Incident report

Generated 2026-05-30T19:51:37.107155+00:00 · Incident #1

Title: Failed login burst
Severity: medium · **Status:** investigating · **Created:** 2026-05-30 19:51:37 UTC

Summary

User admin has 6 failed login attempts in 5 minutes.

Incident status and metrics

Status: investigating · Events linked: 1 · MTTA: 7.9h · MTTR: N/A
Remediation progress: In progress — investigation underway.
Event severity breakdown: medium: 1
Affected source IPs: 127.0.0.1 · Destinations: range-target
Correlation summary: 1 alert(s), 1 correlated event(s), rules: failed_login_burst

Attack timeline (deterministic)

Phase	Timestamp (UTC)	Detail
first_observed	2026-05-30T12:00:05	First linked event (authentication)
authentication	2026-05-30T12:00:05	1 event(s) of type authentication

First event: 2026-05-30T12:00:05 · Last: 2026-05-30T12:00:05

AI narrative (advisory)

The sections below are AI-generated recommendations grounded in linked telemetry. Deterministic metrics and charts above remain the authoritative SOC record.

Executive summary

Repeated authentication failures against the local range target culminated in a successful login after multiple attempts.

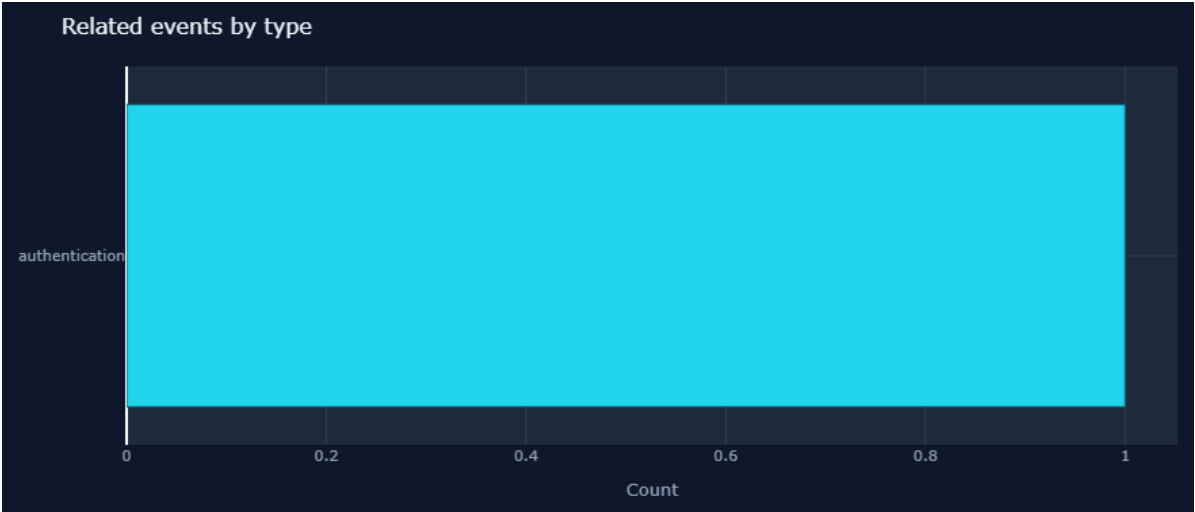

Analysis notes

Root cause: Intentional brute-force simulation against disposable /login endpoint.
Impact: Demonstrates detection of credential stuffing patterns in lab telemetry only.

Remediation

P0: Block source IP at range edge.
P1: Reset disposable range credentials.
P2: Review detection thresholds for production auth logs.

Visual analytics (Plotly)

This chart shows how many linked events fall into each event type (e.g. authentication, network). Higher bars highlight the dominant signal classes the analyst should review first when validating the incident narrative.

Related events
